

POVZETEK

V tem delu iščemo analitične rešitve inverznega kinematičnega problema za neredundantne robotske manipulatorje opisane z Denavit-Hartenbergovimi parametri. Matematičen opis problema nam da sistem polinomskih enačb. Za ideal, ki prinaša temu sistemu, poiščemo z Buchbergerjevim algoritmom Gröbnerjevo bazo – trikoten sistem. Ko ta sistem rešimo, dobimo natanko vse rešitve začetnega sistema. Poleg samega reševanja inverznega kinematičnega problema si z Gröbnerjevimi bazami lahko pomagamo pri iskanju optimalnih trikotnih sistemov za razrede robotskih manipulatorjev. Različne stopnje reševanja inverznega kinematičnega problema in analiza trikotnih sistemov so predstavljene s primeri v programskej paketihi *Mathematica* in *Maple*.

Math. Subj. Class. (1991): 13P10, 68Q40

Key words: Gröbner bases, Buchberger algorithm, ideals, resultants, inverse kinematics, robotics, manipulators, specialized analysis
